Green Oases for Our Cityscapes

The environmental, urban development and engineering advantages of green roofs:

Protection of the Roof Membrane
- Protects the roof membrane from UV radiation, heat, cold and hail

New Habitat
- Avoids sealing and creates new habitat for plants and animals

Rainwater Retention
- Reduces run-off

Dust Binding
- Enhances the micro-climate by filtering out dust and smog particles

Reduction of Energy Costs
- Thermal protection and reduction in heating and cooling costs

Noise Protection
- Enhances sound insulation

Features
Unlike intensive green roofs, extensive green roofs require little upkeep or maintenance.

The features at a glance:
- **Minimum maintenance:**
  - Inspection and maintenance once or twice per year
  - Water and nutrient supply mostly by natural means

- **Plant communities close to nature:**
  - Undemanding
  - Extensive
  - Self-regenerating

- **Low loads and build-up heights:**
  - Mainly substrates with layer depths of up to about 120 mm
  - Loads about 50–150 kg/m²

- **Low-cost:**
  - For set-up and maintenance

Principles
ZinCo extensive green roofs are installed in accordance with current standards and with system.

Our six principles at a glance:
- The System Build-up is tailored to suit each roof.
- The System Build-up ensures permanent drainage, even under load and with a low pitch.
- The System Build-up provides for a good water/air balance.
- The System Build-up is adapted to suit the required type of vegetation.
- The System Build-up keeps maintenance and upkeep to a minimum.
- The System Build-up provides for a long green roof life.

Biodiversity
- The picture shows build-ups with a uniform height. The range of species in the roof habitat can be expanded by varying the substrate depth or type, by installing shingle, sand or gravel surfaces and/or by introducing deadwood or stones. This also contributes to increased biodiversity. The most important thing is to ensure that this is permitted from a roof structural point of view.

All the information regarding vegetation technology is related to moderate continental climate and needs to be adapted in case of any other climate.

Please see our Planning Guide “Systems for Pitched Green Roofs” for information on pitched and steep pitched green roofs.
“Rockery Type Plants” allows for an extensive green roof with sophisticated design and individual character. The “Rockery Type Plants” substrate is applied with a minimum of 70 mm in depth. “Rockery Type Plants” vegetation consists of a wide variety of species which results in a long blooming period and allows for different accents throughout the vegetation period. Sedum species and other perennials are primarily used as a ground cover. Drought resistant perennials add flowering accents and height to the design, *Dianthus carthusianorum* for example reaches up to 400 mm of height. The build-up is realized by manually planting plug plants. Thus the desired result can be predetermined. Furthermore the colour spectrum is significantly more differentiated in comparison to “Sedum Carpet”.

System Build-up “Rockery Type Plants” on 0°-Roofs

On 0°-roofs where deeper puddles might remain, the standard System Build-up “Rockery Type Plants” is to be modified.

By installing higher Floraset® elements (50 or 75 mm) the necessary distance to the water level is ensured. The green roof build-up will be somewhat higher but not heavier as these elements are made of extruded polystyrene hard foam and therefore have a negligible weight. The Protection Mat TSM 32 with its lower retention capacity is sufficient, as water from the puddles is made available to the plants.

Build-up height: ca. 110 mm
Weight, saturated: ca. 120 kg/m²
Water retention capacity: ca. 36 l/m²

With inverted roofs, layers that prevent the diffusion of damp must not be installed above the XPS thermal insulation boards. Therefore, the water retaining protection mat must be replaced by the diffusion permitting Separation Membrane TGV 21. In the case, that root barriers are necessary they have to be placed below the insulation boards directly onto the waterproofing. A deeper substrate layer compensates for the water retention capacity of the protection mat.
“Sedum Carpet” is a shallow, ground-covering extensive green roof type. In moderate climates, it gets along with approx. 60 mm of “Sedum Carpet” System Substrate.

“Sedum Carpet” is applied, especially if both, the load often bearing capacity of the roof and the expenses for maintenance, are restrictive.

Proven sedum species, in combination with the appropriate system build-up, guarantee a long-lasting low maintenance green roof. The plant community “Sedum Carpet” contains various low-growing sedum species. The main blooming time is in early summer, with yellow or red and white flowers dominating at different times. Throughout the year, “Sedum Carpet” is represented in various shades of green. Red shades, particularly in autumn, are a pleasant change in the visual appearance. “Sedum Carpet” is installed either by sedum cuttings or plug plants.

System Build-up “Industrial Green Roofs”

The bigger the roof area, the higher the costs. You can avoid this by omitting certain layers. However, this could be dangerous as certain functions that are important for the long-term proper performance of the green roof are no longer available.

ZinCo, therefore, has combined a number of functional layers in one product. Fixodrain® XD 20 can be installed without an additional protection layer, due to its extremely large contact surface and bonding over a large area. The filter sheet is laminated directly onto it and it is installed in one pass. The elements are attached to each other by means of studs down the long side and the filter sheet overlaps along both the long and the top sides.

System Build-ups with European Technical Assessment. Details on page 15.
System Build-up “Extreme Light Weight” up to a Roof Pitch of 5°

For some roof areas, even the Standard Build-up “Sedum Carpet” is too heavy. The solution is a system build-up with Floraset® FS 75. Less substrate is required as it is not applied equally but mainly fills the gaps between the high studs of the element. Although they start growing mainly in those “planting pots” the Sedum plants still form a dense ground cover which is supported by mosses over the course of time. The build-up weight is approx. 70 kg/m². In areas with little annual precipitation and also on pitched roofs either additional substrate which effects weight and build-up height is required or irrigation is to be provided.

ZinCo Fallnet® – non-roof penetrating fall arrest system

Suitable equipment must be available in order to ensure safe working conditions on flat roofs. Single anchor points are possible as are rail solutions and railings. Any decision when choosing a system should not be made solely in consideration of cost but must also consider the type and scope of the works that are to be carried out on the roof.

All ZinCo fall arrest systems are anchored to the roof by the weight of the green roof build-up, therefore, roof membrane penetration is not necessary.

The Fallnet systems can be integrated into any ZinCo system build-up, provided there are sufficient load reserves available. We will be pleased to draw up a plan specifically for your building.

For further information, please see www.zinco-greenroof.com

Every Fallnet® SR is delivered with an identification label securely attached at the anchor eye. On this label you will find information about the product type, standard testing method, date of manufacture and serial number. If required, this information allows to document, even after decades, the contractor and the planning for this protect.

The horizontally installed rail allows for the use of the whole radius surrounding the gliding runner, which is an ideal and efficient application on narrow roofs.

ZinCo Railing Solutions – attractive, functional and installed on the roof without penetration of the waterproofing.
The development of the solar base has enabled ZinCo to add yet another benefit to the list of advantages of a green roof: the integration of solar energy use into the green roof build-up. With the ZinCo solar base which is integrated into the SolarVert® system build-up, the performance of the green roof as an ecological compensation area is fully preserved.

For further information, please see www.zinco-greenroof.com

Either a solar energy system or a green roof? That was the past! With the system build-up SolarVert® (Fixodrain® XD 20, ZinCo Solar Base® and basic frame), the combination of solar panels and green roof achieve even greater efficiency. And, there is no need to penetrate the roof membrane as the load required to keep the system permanently stable is provided by the green roof itself. The solar bases can be placed wherever they are required on the Fixodrain® layer.

Solar Panel
Solar Base Frame SGR 25/30/45
Plug Plants FB 50 “Sedum Carpet” or Sedum Cuttings
System Substrate “Sedum Carpet”, Depth depends on the superimposed load required
ZinCo Solar Base SB 200
Fixodrain® XD 20
Root Barrier WSF 40 and Filter Sheet PV, if waterproofing is not root-resistant
Roof Drains and Inspection Chambers

Usually, the drainage of flat roofs is achieved through roof drains. Their quantity as well as their dimensioning is to be determined in accordance with European and German Standard DIN EN 12056-3 and DIN 1986. Inspection chambers make sure the roof drains remain accessible and therefore can be cleaned easily, if necessary.

In line with the “German Guidelines for Roofs with Waterproofing”, an upstand height of at least 100 mm above the surface covering is required at the roof perimeter. The parapet should have a covering that slopes towards the roof. The protection mat and, where required the root barrier, are drawn upwards and secured.

Increased loads must be applied to loosely laid roof waterproofing sheets around the roof perimeter and corner areas where there is high wind suction (high building, exposed location …). This is very often provided by means of sufficiently wide and heavy edge strips consisting of concrete slabs or grass pavers.

If in projects with high wind loads the perimeter and corner areas of the roof are to be part of the green roof, the vegetation cover must be closed immediately. EcoSedum® is ideal here. These pre-greened grid elements are securely fixed to each other by an interlocking plug connection system. They are sufficiently permeable when greened so that wind suction forces cannot find purchase.

Pre-cultivated EcoSedum® elements can be used both in combination with concrete slabs (loosely laid waterproofing) and on their own (adhered or mechanically fixed waterproofing layer).

The connection to walls needs to be waterproof. Therefore the protection mat, the waterproofing and the root barrier are taken up at least 150 mm above the finished surface of the green roof build-up and fixed with a protection profile. In front of facades the installation of additional drainage channels is recommended in order to lead rainwater directly into the drainage layer. If only little water is expected, a simple gravel strip is sufficient.
ZinCo Green Roofing Systems now with European Technical Assessment!

In 2013 ZinCo received European Technical Approval ETA with the number 13/0668 for a wide range of proven green roof systems. Since June 2018, the European Technical Approval has been replaced by the European Technical Assessment.

On the one hand, this is a prerequisite for unrestricted access to the European market and its contracting states and, on the other hand, it reassures architects, contractors and owners that the relevant systems and products have passed the mandatory proof procedures and are in accordance with the assessment requirements.

At the moment, the following two build-ups in the EXTENSIVE application range have European technical assessment:

<table>
